

Node.JS Technical Test

Duration: Up to 2 hours

Details:

Write a simple program that calculates the price of a shopping basket. Items are presented one at a time, in a list, identified by name - for example "Apple" or "Banana".

The basket can contain any item multiple times.

Items are priced as follows:

- Apples are 25p each
- Oranges are 30p each
- Garlic are 15p each
- Papayas are 50p each, but are available as 'three for the price of two'

Given a list of shopping, calculate the total cost of those items.

The output should be displayed similar to what you would expect to see on a receipt.
